

Wide tables and page breaks

New in 0.5: a table too wide for the page fits losslessly, and a document can force a page break with the standard CSS break div.

A table that shrinks and wraps

Natural column widths overflow the page, but every column can reach a readable width, so the table renders on one strip with wrapped cell text and nothing lost.

Region name	Engineer on call	Deployment status	Incident summary	Maintenance window
region-a primary	engineer 1, platform team	rollout 1 complete in all zones	0 incidents, none breached budget	weekend 1 of next month
region-b primary	engineer 2, platform team	rollout 2 complete in all zones	1 incidents, none breached budget	weekend 2 of next month
region-c primary	engineer 3, platform team	rollout 3 complete in all zones	2 incidents, none breached budget	weekend 3 of next month
region-d primary	engineer 4, platform team	rollout 4 complete in all zones	3 incidents, none breached budget	weekend 4 of next month

A table that splits into panels

Twenty-four columns cannot fit a letter page even at minimum widths, so the table splits into column panels. Each panel repeats the first column as the key and is marked as continued.

After the second break

This heading started a fresh page because of the break div above. The div itself renders as nothing on GitHub, so a document carrying it stays portable between web view and PDF.
